APPENDIXC: ESTIMATES OF MUNICIPAL AND INDUSTRIAL SALT LOADS

Introduction

The salinity (electrical conductivity, or EC) of the lower San Joaquin River (SJR) exceeds the maximum concentrations allowed in the Central Valley Regional Water Quality Control Board's (Regional Board) Water Quality Control Plan for the Sacramento River and San Joaquin River Basins (Basin Plan) (CVRWQCB, 1998). A reduction in salt loadings to the lower SJR is needed to bring it into compliance with the Basin Plan criteria. Salt loadings to the river come from sources such as irrigated agriculture, wetlands processes, and municipal and industrial (M&I) activities. The objective of this document is to present Regional Board staff estimations of salt loading to the lower SJR from M&I activities.

Methods

The sources of M&I salt loading include municipal, industrial, and domestic. The total salt loads generated and the amount of salt loads that directly enter the SJR (not land disposal) are quantified. Salt loads directly discharged to the SJR are determined for the irrigation (April through August) and non-irrigation seasons (September through March).

Sources of Salt Loading

Municipalities and Connected Industries

The eight municipalities (and their connected industries) that were accounted for in this study were Modesto, Merced, Turlock, Atwater, Patterson, Newman, Gustine, and Planada. Connected industries are those industries that discharge their wastewater into municipal wastewater treatment plants.

External Industries

There are 13 external industries accounted for in this report that are not connected to wastewater treatment plants and that have their own NPDES permits. These industries include San Joaquin Valley Dairymen, Huntsman Film, California Department of Fish & Game, Calaveras Trout Farm, Hershey, Hunt-Wesson, Sunseed Processor, and the City of Modesto Grayson reverse osmosis well. There are five groundwater pump-and-treat (hazardous waste cleanup) activities that are not industrial activities, but are grouped here for simplicity. These are the two General Electric cleanups, the U.S. Army Riverbank cleanup, the Stanislaus Farm Supply cleanup, and the Western Farm Service cleanup. The Castle AFB cleanup passes their effluent to the City of Atwater, so its salt loads are accounted for in Atwater's municipal data.

Domestic

Identifying the salt loads from domestic use of supply water gives an idea of the contributions to the overall salt loading. The personal use data can assist in differentiating the source of municipal salt loads, personal use or industries and commercial uses.

Appendix C: ESTIMATES OF MUNICIPAL AND INDUSTRIAL SALT LOADS
July 2004 Draft Final Staff Report

Calculating Salt Loads

Flow rates and salt concentrations were calculated for external industries, municipalities, and personal use. Flow rates and salt concentrations for external industries and municipalities were determined from NPDES self-monitoring data, engineering reports, and personal conversations with plant operators and Regional Board staff. Information on personal use was determined using U.S. national averages of individual water use.

Modesto and Turlock Point Source Loads

Historical Modesto and Turlock wastewater treatment plant (point source) effluent flow, and constituent concentration monitoring data, were provided to Regional Board staff for the monitoring period from 1995 to 2002 (Attachments 4 and 5). City personnel provided flow data in units of millions of gallons per day (mgd) on a daily basis. Sporadic water quality monitoring data were also provided for 1995 to 2002. Salinity concentrations are reported as electrical conductivity (EC) in units of micro siemens per centimeter ($\mu\text{S}/\text{cm}$) and total dissolved solids (TDS) in milligrams per liter (mg/L). The TDS data was used exclusively to calculate loads.

The city of Modesto only discharges to the LSJR form October through May and the City of Turlock discharges to LSJR year round. Most of the treated effluent from the City of Modesto's treatment plant is applied to land during the non-discharge season, which runs from June through September.

Monthly salinity loads generated by the Modesto and Turlock wastewater treatment plants are a product of mean monthly flow, mean monthly concentration data and a conversion factor. The following sections provide descriptions of the method used to estimate the mean monthly flow, concentration and loads (Attachment 3) from the raw data provided by the cities of Turlock and Modesto.

Step 1: Calculation of Mean Monthly Flow

Daily flow data were first converted from units of mgd to acre-feet per day using a conversion factor of 3.0689. The daily flow data for each individual month were summed to determine total monthly flow for each month of the period of record. A simple mean of monthly means for a given month (eg. January 1995, January 1996, ...January 2002 etc.) was used to estimate mean monthly flow that month.

Step 2: Calculation of Mean Monthly Flow Weighted Average Concentration

The monthly flow weighted average (FWA) concentration for each month in the period of record was calculated using the available daily data. This was accomplished by dividing the sum of flow x TDS by the sum of flow (for each day in a given month when flow and TDS were both reported). The simple mean of the monthly means of TDS for each month (eg. January 1995, January 1996, ...January 2002) was used to estimate mean monthly FWA TDS.

Step 3: Mean Monthly Loads

Appendix C: ESTIMATES OF MUNICIPAL AND INDUSTRIAL SALT LOADS
 July 2004 Draft Final Staff Report

Mean monthly loads are the product of the mean monthly flow, mean monthly flow weighted average TDS, and conversion factor of 0.001359 (Conversion of Acre-Ft x mg/L to tons).

Step 4: Mean monthly concentration (TDS)

The mean monthly FWA TDS concentration was determined by dividing the mean monthly loads by the mean monthly Q times a conversion factor of 0.001359. Results are in Table C1. [Mean monthly FWA TDS concentration in mg/L = mean monthly load in tons / (mean monthly Q in acre-feet x 0.001359)].

Table C1: Mean Monthly Municipal and Industrial Salt Loads Discharged Directly to the LSJR						
	Modesto			Turlock		
Month	Mean Monthly Q (acre-feet)	Mean FWA TDS (mg/L)	Mean Monthly M&I Salt Loads (tons/month)	Mean Monthly Q (acre-feet)	Mean FWA TDS (mg/L)	Mean Monthly M&I Salt Loads (tons/month)

Footnotes

Q = Discharge volume

FWA = flow weighted average concentration

TDS = total dissolved solids

mg/L = milligrams per liter

M&I = municipal and industrial

Mean monthly loads = TDS * Q

Irrigation season = April through August

Appendix C: ESTIMATES OF MUNICIPAL AND INDUSTRIAL SALT LOADS
July 2004 Draft Final Staff Report

Sources of Salt Loading

Municipalities and Connected Industries

The total municipal salt load generated by the eight municipalities (and their connected industries) located in the lower SJR is about 47 thousand tons/year (Attachment 1). The average annual flow rate from the municipalities sums to about 52 mgd (Table C2).

Table C2. Magnitude of Municipal Wastewater Effluent Flow Rates

Municipality	Effluent Flow Rate (mgd) ¹
Modesto	27
Turlock	11.4
Merced	7.1
Atwater	3.3
Newman	1.2
Gustine	0.8
Patterson	0.8
Planada	0.3
TOTAL	51.9

¹ Arithmetic yearly average flow rate of monthly average flow rates.

Direct Discharges To San Joaquin River Over Entire Year

Of the 47 thousand tons/year of salt load generated by the eight municipalities (and their connected industries), about 23 thousand tons/year are discharged directly into the San Joaquin River solely by Modesto and Turlock. The remaining 24 thousand tons/year of salt load are discharged to land irrigation or wetlands. The wastewater flow rate discharged to the San Joaquin River over the year averages to 21 mgd, with approximately 31 mgd from land irrigation or wetlands.

Direct Discharges to San Joaquin River During Irrigation and Non-Irrigation Seasons

Of the 23 thousand tons/year of salt load that directly enters the lower SJR, approximately 6,500 tons/year enters during the irrigation season and approximately 16,500 tons/year enters during the non-irrigation season. Additional data is shown in Attachment 1. The protocol used to estimate the US National Average personal salt contribution is summarized in Attachment 2. The raw data provided by the Cities of Modesto and Turlock, used to calculate mean monthly flows and salt loading are provided in Attachments 3 and 4 respectively.

External Industries

External industries not connected to municipal systems discharge about 7 thousand tons of salt per year (Table C3). The average annual flow rate from these sources is about 11 mgd (not counting the high flow rates and low EC values from the Calaveras Trout Farm). It is assumed that the external industries do not directly discharge to the SJR.

Appendix C: ESTIMATES OF MUNICIPAL AND INDUSTRIAL SALT LOADS
 July 2004 Draft Final Staff Report

Table C3. Salt Loads from External Industries

Industry	Flow Rate ¹ (mgd)	Electrical Conductivity ¹ ($\mu\text{mhos}/\text{cm}$)	Salt Load (tons/yr)
San Joaquin Valley Dairymen	0.2	1030	200
Huntsman Film Products	0.3	290	90
Combined GE Groundwater Cleanup	1.2	450	530
California Department of Fish and Game	2.0	50	100
Calaveras Trout Farm	27	40	1050

Flowers Worm Farm ²	N/A	N/A	N/A
U.S. Army Riverbank Cleanup	1.5	355	520
Stanislaus Farm Supply	0.22	1200	260
Western Farm Service, Vernalis	0.086	700	60
City of Modesto Grayson Well ³	0.3	1950	560
TOTAL	10.9⁴		6720

¹ Values are approximate.

² This facility has not submitted their monitoring reports.

³ Results from producing domestic water by electrodialysis.

⁴ Does not include the Calaveras Trout Farm.

Personal Use

Personal use of domestic supply water contributes approximately 8,200 tons of salt per year to the lower SJR. The source water for these people, using the 60 gallons/person/day national average and the actual EC from each of the municipalities' source waters, results in another 7,800 tons/year. This sums to a total of 16 thousand tons/year just from personal use.

This amounts to 34% of the actual 47 thousand tons/year of the municipal load (with its connected industries), indicating that approximately 31 thousand tons/year comes from the connected industries. It should be emphasized that these U.S. national average figures just give estimates for the Merced/Stanislaus municipalities of the production of salt loads through personal use. The calculated personal loads for each municipality are shown in Attachment 1 (and are called generic loads there).

Usage Increase In EC

The increase in electrical conductivity (EC) between the source water to the communities and its wastewater varies quite a bit. This increase ranges from 250 $\mu\text{mhos}/\text{cm}$ up to 3,360 $\mu\text{mhos}/\text{cm}$, as shown in Table C4.

Appendix C: ESTIMATES OF MUNICIPAL AND INDUSTRIAL SALT LOADS
 July 2004 Draft Final Staff Report

Table C4. Municipal and Industrial Additions to Source Water Salinity

Municipality	Source Water Electrical Conductivity ($\mu\text{mhos}/\text{cm}$)	Wastewater Effluent Electrical Conductivity ($\mu\text{mhos}/\text{cm}$)	Increase in Electrical Conductivity ($\mu\text{mhos}/\text{cm}$)
Gustine	960	4320 ³	3360
Newman ¹	1550	2750	1200
Modesto ²	280	1280 ⁴	1000
Patterson	1360	1980 ^{3,5}	620
Turlock	280 ⁶	810 ^{4,5}	530
Merced	330	610 ^{3,5}	280
Atwater	310	560 ^{3,5}	250
Planada	N/A ⁷	540 ³	N/A'

¹ Source water and wastewater effluent electrical conductivity from Carollo Engineers report, from personal communication with City of Newman.

² Modesto source water assumed to be one-half Modesto Irrigation District water (60 $\mu\text{mhos}/\text{cm}$) and one-half groundwater (525 $\mu\text{mhos}/\text{cm}$). The EC of the MID source water was after its salinity had been increased to minimize pipeline corrosion. The wastewater effluent EC represents October through May only, as EC values are not measured during June through September (not required by NPDES permit). The EC was measured at the oxidation pond prior to discharge into the SJR, and not at the wastewater treatment plant.

³ The monthly EC values used in the calculations are from 1999.

⁴ The average EC obtained was for 1995 through 1998.

⁵ Flow-weighted from monthly data.

⁶The City's source water averages 280 uS/cm, with a maximum detection of 489 uS/cm. The variation is due to the fact that the City derives its source water from twenty-two different groundwater sources, all with varying levels of salinity. This information is based on a 20 January 2004 letter from Nicole Granquist with Downey Brand-Attorneys representing the City of Turlock.

⁷ A Planada representative phoned to say that they do not measure the EC or TDS of their source water.

Discussion

Portion Of Population

Not all of the municipal and industrial salt loads generated in the lower San Joaquin River area were accounted for in this study. The total population of Merced and Stanislaus Counties is 633 thousand people (State Dept. of Finance, 1999). The eight municipalities above account for 342 thousand people, or 54% of the total population.

Population Vs Salt Loading Relationships

There is no direct relationship between a municipality's population and its salt loads, probably as a result of the specific industries connected to each municipality. For example, Merced (population 62,000) has about ten times more population than Newman (population 6,025), yet Merced has a total salt load of 4,280 tons/year while Newman has a total salt load of 3,460 tons/year.

Effects Of Industrial Inputs

Metcalf and Eddy (3rd edition) states that personal use of water adds 150-380 mg/L TDS without considering industrial additions. If 265 mg/L TDS is considered to be the average, and the relationship $\text{EC} = 0.65 \times \text{TDS}$ is used, this gives a national average increase in EC of 408 $\mu\text{mhos}/\text{cm}$. (It is interesting to note that some future Regional Board NPDES permits will allow an EC increase of "source water + 600" μmhos) Now, looking at Table C4, which shows data with industrial inputs included, one can say Atwater, Merced, Turlock, and Patterson are near or below the national average and

Appendix C: ESTIMATES OF MUNICIPAL AND INDUSTRIAL SALT LOADS
July 2004 Draft Final Staff Report

therefore appear to have little industrial input. However, Modesto and Newman are two–three times this national average and thus reflect a sizeable input of industrial salts. Gustine is about eight times this national average and thus reflects a very large input of industrial salts.

Separating Personal Salt Contributions From Industrial Contributions

Utilization of the U.S. national averages can allow one to estimate the salt loads produced from personal use and that produced from industrial use (combining both connected industrial loads and external industrial loads). Use of the U.S. national averages estimates that 16 thousand tons/year are from personal use. Adding the remainder of the 47 thousand tons/year, which is 31 thousand tons/year, to the 7 thousand tons/year produced from external industrial loads gives an estimate of 38 thousand tons/year coming from all industrial loads. So 16 thousand tons/year is from personal use, and 38 thousand tons/year is from industrial use (all sources).

Groundwater Input To Salt Loads

While it has been estimated here that 23 thousand tons/year of salts directly enter the San Joaquin River, the remaining annual load of 24 thousand tons/year (47 thousand tons/year – 23 thousand tons/year) may also be entering the river through groundwater inflow. A determination of groundwater flow direction and hydraulic conductivity will be needed in order to substantiate this assumption.

Data Availability And Assumptions

Sufficient data was available to allow for estimations of the salt loads. More time and site-specific knowledge would allow for refinements to the estimations. Conversions between EC and TDS used the relationship $TDS = 0.65 \times EC$, which is only an approximate relationship.

Appendix C: ESTIMATES OF MUNICIPAL AND INDUSTRIAL SALT LOADS
July 2004 Draft Final Staff Report

Attachment 1 Notes:

- ¹ Direct discharge to the San Joaquin River only, it does not include land disposal (i.e., irrigation, wetlands, subsurface drains, etc.) that may eventually enter the river.
- ² Modesto cannot discharge to the river from June through September.
- ³ This "real data" is used in the final determinations of salts to the river.
- ⁴ Generic mean adds the national mean (Metcalf and Eddy text) of an additional 265 mg/L of TDS per person to the source water TDS. This represents domestic use without including industrial additions.
- ⁵ Source water TDS obtained from Pat Ryan, Modesto Irrigation District and Lenora Hill, City of Modesto.
- ⁶ Calculated from 1998 real data.
- ⁷ Average of years 1995-1998.
- ⁸ Source water TDS obtained from Debbie Livermore, City of Merced.
- ⁹ Source water TDS obtained from Dan Madden, City of Turlock.
- ¹⁰ Source water EC obtained from Monte Hammamoto, City of Atwater.
- ¹¹ Real data summary from Carollo Engineers report, from personal communication with City of Newman.

Attachment 2. Estimation of Personal Salt Contributions Using U.S. National Averages¹

1. Metcalf and Eddy, Table 2.1, shows that the typical municipal water use in the U.S. ranges from 40-130 gallons/person/day, and that the average is 60 gallons/person/day.
2. Metcalf and Eddy, Table 3.19, shows that the increase in TDS from domestic use ranges from 150-380 mg/L, but gives no average increase. Assume for the purposes of this calculation that the increase will be the average of this, or 265 mg/L. These values do not include commercial or industrial contributions.
3. Multiplying the 60 gallons/person/day times the 265 mg/L gives 0.132 pounds of salt/person/day.
4. Multiplying the 0.132 pounds of salt/person/day times the population of a given municipality yields the pounds of salt added to the source water for that municipality. For example, Turlock has a 1999 population of 51,900 people, so its salt load from personal use would be 6,850 pounds of salt per day.
5. To then obtain the salt loads produced from Turlock from the source water one would then multiply the 60 gallons/person/day times the TDS of the source water (250 mg/L in the case of Turlock), to arrive at 0.125 pounds of salt per person per day. Multiplying this figure by the 51,900 people in Turlock gives 6,487 pounds of salt per day.
6. Then, the total salts estimated to be produced by Turlock from personal use = salts produced from personal use + salts from the source water = 6,850 pounds/day + 6,487 pounds/day = 13,337 pounds/day, or 6.7 tons/day.
7. It must be recalled that this is the salt contribution solely from personal use of the source water, based solely on U.S. national averages. To it must be added the salt contributions from commercial and industrial uses of the water.
8. The advantage of using the above figures are that they give us a ballpark figure of the personal salt loads generated by the San Joaquin River municipalities if no other data is available. They also allow us to look at the data from the San Joaquin River municipalities, which contains salts from industrial sources as well as from personal use, and subtract out the estimations of personal amounts to get a ballpark figure of the amounts of salt input by the industries.

¹ Information obtained from Wastewater Engineering, Metcalf and Eddy, 3rd Edition, 1991.

1-sum of flow for days in month when TDS data is reported
 2-sum flow multiplied TDS for days in month when both flow and TDS were reported
 3-TDS*Q divided by partial flow
 4-FWA TDS multiplied by total flow and a conversion factor of 0.001359
